Poor man's GPT-3: Few shot text generation with T5 Transformer

Minimalistic code for few-shot text generation with HuggingFace

Original Sentence	False Sentence
The cat is alive	The cat is dead
It is a safe neighbourhood	It is a dangerous neighbourhood
The little kid was happy and joyful.	

T5 → The little kid was **sad**.

Image by Author

The concept of feeding a model with very little training data and making it learn to do a novel task is called **Few-shot learning**.

A website [GPT-3 examples](#) captures all the impressive applications of GPT-3 that the community has come up with, since its release. GPT-3 is shown to generate the **whole Frontend code** from just a text description of how a website looks like. It is shown to generate a **complete marketing copy** from just a small brief (description). There are many more impressive applications that you can check out on the website.

GPT-3 essentially is a **text-to-text** transformer model where you show a **few examples (few-shot learning)** of the input and output text and later it will learn to generate the output text from a given input text.

The GPT-3 prompt is as shown below. You enter a few examples (input -> Output) and **prompt** GPT-3 to fill for an input.

GPT-3 Prompt Format

Translate English to French: → **Task Description**
sea otter => loutre de mer → **Example 1**
peppermint => menthe poivrée → **Example 2**
cheese => → **Prompt**

fromage

Now being aware of the text-to-text capabilities of T5 Transformer by Google while working on my opensource question generation project Questgen.ai, I decided to push T5 to do the same on an untrained task and see the results.

I must say the results are pretty **impressive** for a base T5 model by making it learn from just a few (~10) examples.

247

1

So the task I gave was this —

Few shot text generation with T5 Transformer

Original Sentence	False Sentence
The cat is alive	The cat is dead
It is a safe neighbourhood	It is a dangerous neighbourhood
The little kid was happy and joyful.	 
	 The little kid was sad.

Image by Author

Input :

I gave a few **sentence pairs** that are **false sentences** of each other by replacing the **main adjective** with its **opposite** word.

Eg: The cat is **alive** => The cat is **dead**

And after training with only (~10 samples) and < 5 mins of training T5 was able to

T5 Generated sentences (picked from top 3 responses through beam search) :

- The sailor was **unhappy**.
- The sailor was **sad**.

Prompt to T5: The tortoise was very **slow**.

T5 Generated sentences (picked from top 3 responses through beam search) :

- The tortoise was very **fast**.
- The tortoise was very **quick**.

Without much further ado let's look into the code.

Code

Coming up with the code was an interesting **exploration** for me. I had to go through [Hugging Face](#) documentation and figure out writing a **minimalistic** forward pass and backpropagation code using the T5 transformer.

Colab Notebook

A cleanly organized Google Colab notebook is available [here](#)

1.1 Installation

Install HuggingFace transformers and check GPU info on Colab.

```
!pip install transformers==2.9.0  
  
!nvidia-smi
```

1.2 Necessary Imports and model download

First a few necessary imports from transformers library-

[Open in app](#)[Get started](#)

```
import torch
from torch.utils.data import Dataset, DataLoader

from transformers import (
    AdamW,
    T5ForConditionalGeneration,
    T5Tokenizer,
    get_linear_schedule_with_warmup
)

def set_seed(seed):
    random.seed(seed)
    np.random.seed(seed)
    torch.manual_seed(seed)

set_seed(42)
```

Initialize the model and its tokenizer -

```
tokenizer = T5Tokenizer.from_pretrained('t5-base')
t5_model = T5ForConditionalGeneration.from_pretrained('t5-base')
```

Initialize the optimizer —

Here we are mentioning which parameters of the T5 model needs to be updated after calculating the gradients of every parameter w.r.t to the Loss.

```
# optimizer
no_decay = ["bias", "LayerNorm.weight"]
optimizer_grouped_parameters = [
    {
        "params": [p for n, p in t5_model.named_parameters() if not
any(nd in n for nd in no_decay)],
        "weight_decay": 0.0,
    },
    {
        "params": [p for n, p in t5_model.named_parameters() if any(nd
in n for nd in no_decay)]
```

1.3 Training data

The complete training data (~10 samples) that is used for our T5 few-shot text generation task.

1.4 Training the model

[Open in app](#)[Get started](#)

(optimizer. step) which is standard for all deep learning algorithms.

Most of the effort was in understanding and getting T5 training to this simple loop :)

That's it. Depending on the GPU, the model is trained in 5 mins or less and it is ready for testing with some unseen samples.

[Open in app](#)[Get started](#)

Using beam decoding we get the top 3 sentences generated from the code as -

- The sailor was **unhappy**
- The sailor was **sad**

The sailor was happy

[Open in app](#)[Get started](#)

Test Sentence: The tortoise was very **slow**.

Using beam decoding we get the top 3 sentences generated from the code as -

- The tortoise was very slow
- The tortoise was very **fast**

[Open in app](#)[Get started](#)

As you can see T5 is able to generate a false sentence of a given sentence even if it has not seen those **adjectives** or **sentence words** previously in training.

Bonus

If you have come this far, I have a bonus for you :)

Find the same code in the **Pytorch Lightning** format using the **latest version** of HuggingFace [here](#)

Question Generation using NLP — A course

I launched a very interesting Udemy course titled “Question generation using NLP” expanding on some of the techniques discussed in this blog post. If you would like to take a look at it, here is the [link](#).

Conclusion

Hope you enjoyed how we explored T5 for **few-shot** text generation task, just like GPT-3.

When I started exploring T5 last year I realized its potential. It can do quite a few text-to-text tasks very efficiently.

Happy NLP exploration and if you loved the content, feel free to find me on [Twitter](#).

If you want to learn modern NLP using transformers, check out my course [Question generation using NLP](#)
